Fentanyl Exposure, Protection, and Treatment
Myths and Facts

Information from Health Canada’s Public Service Occupational Health Program (Adapted from USA Dept. of Homeland Security 2017)

**EXPOSURE**

► **FACT:** Incidental skin exposure to fentanyl is extremely unlikely to immediately harm you.
  - Fentanyl and other potent synthetic opioids may appear as a powder, tablet, capsule, or in solution
  - Inhaling or transferring fentanyl from skin to mucous membranes (eyes, nose or mouth) are the most common types of incidental exposure
  - **DO:** wash the affected area with soap and water as soon as possible to easily remove fentanyl residues
  - **DON’T:** use alcohol-based hand sanitizers, wipes or products. They may increase absorption of fentanyl

► **FACT:** First responders’ encounters with overdose victims and contaminated environment do not present a significant drug exposure threat to responders.
  - Experts agree that routine encounters to fentanyl does not present a significant risk of drug exposure
  - **DO:** ensure that all commonly used controls and protocols are followed
  - **DON’T:** use alcohol-based hand sanitizers, wipes or products. They may increase absorption of fentanyl

► **FACT:** Most first responders’ encounters with overdose victims and contaminated environment do not present a significant drug exposure threat to responders.
  - Experts agree that routine encounters to fentanyl does not present a significant risk of drug exposure
  - **DO:** ensure that all commonly used controls and protocols are followed
  - **DON’T:** use alcohol-based hand sanitizers, wipes or products. They may increase absorption of fentanyl

**PROTECTION**

► **FACT:** Worn correctly, Personal Protective Equipment will protect you.
  - **DO:** wear PPE identified for the task when exposure to drug powders is likely
  - PPE includes gloves, properly fitted respiratory protection, and safety eyewear
  - See CSA reference below for additional information regarding PPE selection
  - **DON’T:** use powdered gloves; powder particulates from the gloves may absorb and spread contaminants to unintended surfaces

► **FACT:** Occupational Health and Safety precautions on contact with unknown powdered substances are appropriate for most incidental encounters with fentanyl.
  - **DO:** avoid direct contact with fentanyl if possible
  - Wear appropriate PPE identified as required for the specific task or activity
  - Wash your hands with soap and water often and after handling suspicious substances
  - Soap and water is a useful control to reduce powder contamination
  - Use proper decontamination and notification procedures for contaminated equipment or clothing
  - **DON’T:** eat, drink or smoke after handling a suspicious substance until you have washed your hands

**TREATMENT**

► **FACT:** Naloxone (e.g. NARCAN Nasal Spray) is safe and counteracts the effects of an opioid overdose including fentanyl and other synthetic opioids.
  - **DON’T:** delay. Administer naloxone (following departmental policy and protocols), if you suspect an overdose
  - **DO:** In the event of a suspected opioid overdose, call immediately for emergency medical assistance
  - Naloxone is not a definitive medical treatment
  - The effects of naloxone are time limited; administer additional dose of naloxone if necessary, or if signs and symptoms reappear
  - If naloxone is not available, provide rescue breathing or life-saving efforts until emergency services arrive

► **FACT:** Fentanyl overdose signs/symptoms are the same as for all opioid overdoses: slowed/shallow breathing, decreasing consciousness, pinpoint pupils.
  - **DO:** administer naloxone if you suspect an overdose
  - **DON’T:** confuse a fentanyl overdose with the signs and symptoms of other conditions
  - Dizziness, rapid heart rate, nausea and vomiting, or “feeling ill” are more specific to heat injuries, dehydrations, and adrenaline responses
  - **When in doubt, administer naloxone and call for emergency medical assistance**
